

What is a website with dynamic content? (or corporate portal, only changes to the way in which services are presented and for some more active form).

To explain it quickly enough I summarize its main characteristic, that is achieved once a graphic template and uploaded to the online customer provides the password to access and update all the content via a simple web interface, including attached images news, catalogs, etc.. without even having to worry about image compression or uploading files via ftp and more.

This is possible precisely because the site content is separated from the structure graphics and therefore do not need the webmaster every time you want to change even a phone number or photo of your home.

Another feature, in my opinion quite important, is that because of the nature of this kind of sites where content is separate from the graphics there is a possibility at any time to change all the graphics simply by applying templates tailored and without having to reload any of the information already included (like the big portals and search engines such as holidays when they change their appearance).

Finally everything is developed in PHP, a language that is not completed and therefore remains freely editable by anyone who knows (ie the site on the server side is already the source files) and the database engine used is MySQL (which being free does not require expensive licenses).

Corporate website with dynamic content

- Custom chart templates (presentation 2 / 3 drafts)
- Pages / modules active:
 - News with image insertion
 - Form for insermento of unlimited web site automatically with automatic attribution of the graphics of this site
